Biofilms : formation, development and properties (eBook ...

A biofilm is an aggregate of microorganisms in which cells adhere to each other and or to a surface. This book presents research in the study of biofilms including bacteriophages and biofilms, dynamic models for in vitro biofilm formation, symbiotic biofilms and brain neurochemistry and mineralisation of sedimentary biofilms.

In UPEC, efforts have concentrated on the development of compounds that interfere with the adhesive properties or assembly of type 1 pili, because they are the prevalent means for UPEC adherence during biofilm formation in vitro and within the host.

Biofilm Formation an overview | ScienceDirect Topics

J. Malheiro, M. Simões, in Biofilms and Implantable Medical Devices, 2017. Abstract. Biofilm formation is a strategy by which microorganisms survive and adapt to the involving environment, particularly adverse conditions.

Physicochemical regulation of biofilm formation

(1) Physical properties of surfaces regulate cell attachment and physiology and affect early stages of biofilm formation. (2) Chemical properties influence the adhesion of cells to surfaces and their development into biofilms and communities. (3) Chemical communication between cells attenuates growth and influences the organization of communities. Mechanisms of spatial and temporal confinement ...
